Question (gsm8k tier): Jame will turn 27 in 5 years. In 8 years his cousin will be 5 years younger than twice his age. How many years separate the age of the two now?

s_1: If Jame will turn 27 in 5 years, then currently he is 27 - 5 = 22 years old.

s_2 **first error:** $e = 2$, $\rho = e/n = 0.50$: In 8 years, his cousin will be 2 * 22 - 8 = 46 - 8 = 38 years old.

s_3 *(after the error)*: To find out how many years separate the age of the two now, we need to subtract their current ages from each other: 38 - 22 = 16.

s_4 *(after the error)*: The answer is: $\boxed{16}$

Outcome: final answer incorrect ($y = 1$); $n = 4$ steps, 2 step(s) remain after the first error.
